

FRESH & DRY MICROFIBER LINING is a shoe lining equipped with very special properties and characteristics that make it the ideal substitute for those who do not want to use genuine leather, at the same time that they do not want to give up the advantages that it offers.

It has a structure formed by micro filaments arranged in the shape of a star that give it an **extraordinary absorption and drying capacity**, avoiding the humidity of the foot and therefore the formation of bacteria and bad odors. It is **washable at temperatures of up to 95°**, remaining all its characteristics and properties unchanged.

It is **indeformable** in addition to having a **resistance to abrasion and bending** much higher than that of leather.

It has a **neutral pH** compatible with all skin types.

It is **ECOFRIENDLY** and respectful with the environment, if we compare its production process with that of leather we can see that for each meter produced 50% of CO2 emissions are saved, 170KG of wastewater and 1.5KG of solid waste.

It complies with the strictest international regulations regarding restricted harmful chemicals. In this way you can avoid all the problems and farragosity inherent in the skin.

It is therefore the ideal substitute for the skin, but without the problems that the use of this entails.

CURTYPLAST has permanent stock in more than 50 colors, whose quality is reviewed by our staff and periodically checked in internationally recognized laboratories in order to offer them the best possible product.
